there is an efficient randomized algorithm running in  $O(n^2 \log q)$  time. For max-flow algorithm. 10.2.1. The Contraction Algorithm Revisited We start by reviewing the the contraction algorithm described in Section 1.1. Actually, we present only an abstract version of this algorithm and leave the implementation details as an exercise.

## **Randomized Algorithm - Spring 2009 - Home page**

A randomized algorithm is an algorithm that employs a degree of randomness as part of its logic. The algorithm typically uses uniformly random bits as an auxiliary input to guide its behavior, in the hope of achieving good performance in the "average case" over all possible choices of random bits. Formally, the algorithm's performance will be a random variable determined by the random bits ...

In bioinformatics, a good example of a Monte Carlo randomized algorithm is the random projections algorithm (Buhler and Tompa, 2001, 2002) for motif finding. Another common example of a Monte Carlo algorithm is the Freivald's algorithm ( Freivalds, 1977 ) for checking matrix multiplication.
