The Aging Bladder [EPUB]

Bladder cancer is the fifth most common type of cancer in the United States of America. This type of malignancy mainly affects the epithelial lining (inner lining) of the urinary bladder. The most common symptoms associated with bladder cancer include painful urination (dysuria), blood in urine (haematuria) with frequent urge to urinate (urinary urgency).

Aging per se may cause changes in bladder structure and function, but other concomitant disorders such as, bladder outflow obstruction, diabetes mellitus, neurogenic disorders, and ischemic bladder dysfunction, are often associated with UAB/DUA and may aggravate aging-induced reduction in bladder function.

Pathophysiology and Associations of Underactive Bladder ...

“As you get older, the bladder changes. The elastic bladder tissue may toughen and become less stretchy. A less stretchy bladder cannot hold as much urine as before and might make you go to the bathroom more often. The bladder wall and pelvic floor muscles may weaken, making it harder to empty the bladder fully and causing urine to leak.”
